Laurie Marshall - Writing Sample

This is one section from a six-part Getting Started Guide that I wrote for one of our products in 2023. The content is redacted. Actual company and product names have been changed to ABC.

Two-factor authentication for ABC

Two-factor authentication (2FA) adds a second layer of security to the ABC logon process. After entering your user name and password, you must enter a security code (from your email or mobile device) to finish logging on. This significantly reduces the likelihood of unauthorized access to your ABC environment.

By default, ABC uses email authentication; however, you have the option of using mobile authentication instead. ABC supports the following mobile authentication apps:

- Citrix SSO
- Duo Mobile
- Google Authenticator
- Microsoft Authenticator

Notes:

- *Passcode and one time passcode (OTP) are other names for 2FA security codes. You'll notice the ABC email authentication screen prompts you to* ***Enter OTP from Email****, while the mobile authentication screen prompts you to* ***Enter Authentication Passcode****.*
- *Two-factor authentication is commonly referred to as multi-factor authentication (MFA) and two-step verification.*

Setting up mobile authentication

This section provides instructions for setting up a mobile device for ABC two-factor authentication (2FA). Complete this procedure if you want to receive security codes on a mobile app. This is an alternative to using email authentication, which was set up by default during your initial logon.

Tip: After you set up mobile authentication, it's easy to change back to email authentication if needed.

Prerequisite:

Install one of the following ABC-supported authentication apps on your mobile device:

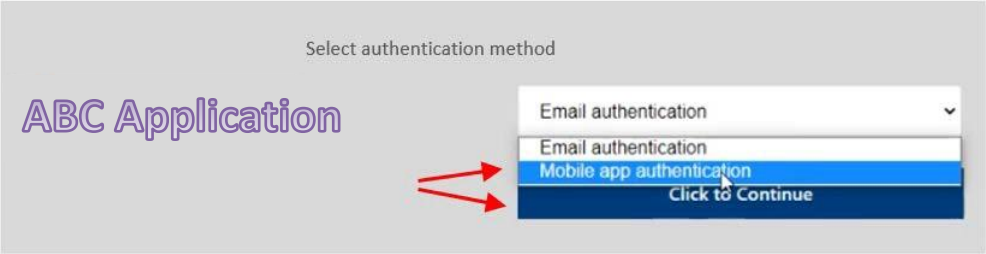
- Citrix SSO
- Duo Mobile
- Google Authenticator
- Microsoft Authenticator

If you decide to use a mobile app that is not supported by ABC and problems occur, you will need to install a supported app.

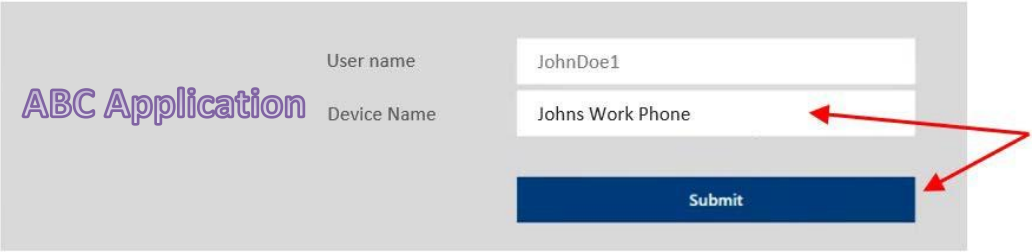
Tip: Don't confuse Google Authenticator or Duo Mobile with Google Duo. Google Duo is not a 2FA app and is not used for ABC.

Steps:

1. Open Chrome and go to https://ABC_co.ondemand.com.
2. Enter your **User name** and **password**, and click **Submit**.
3. On the next screen, select **Mobile app authentication** and **Click to Continue**.



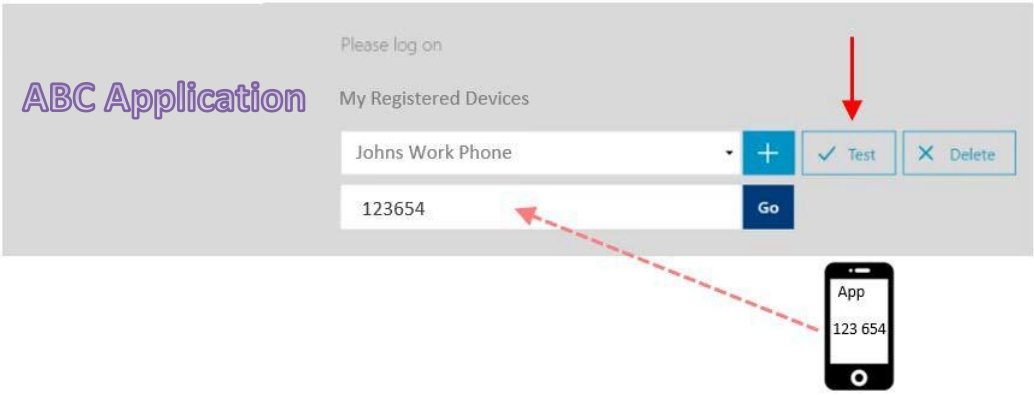
4. Enter a name for your mobile device in the **Device Name** field and click **Submit**.
   - This can be any name you choose. It doesn't correspond to any information or settings on your physical mobile device. The **Device Name** is used as an identifier to register your mobile device with ABC 2FA.



5. On your mobile device, open the authenticator app and scan the QR code.
   - Check your mobile device and verify that the app is displaying a new security code.

6. Click **Done**.

   Your device is now registered and added to the **My Registered Devices** list.
7. Click **Test.**
8. Enter the mobile app security code in the **OTP value to test** field.
   - Do not include spaces.
   - Click **Go**.



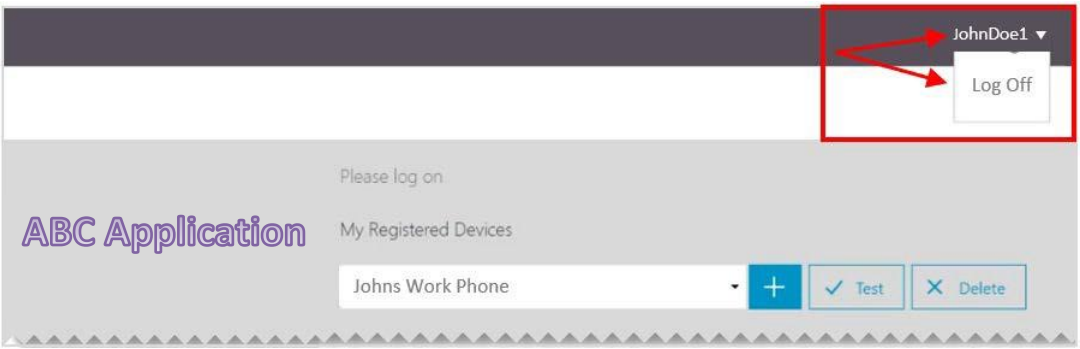
When you see the *Successfully verified OTP* message, the process is complete and your mobile device can now be used to log on to ABC.

9. *(Optional)* If you want to add another mobile device, click the **+** button, enter a new **Device Name**, and click **Go**.

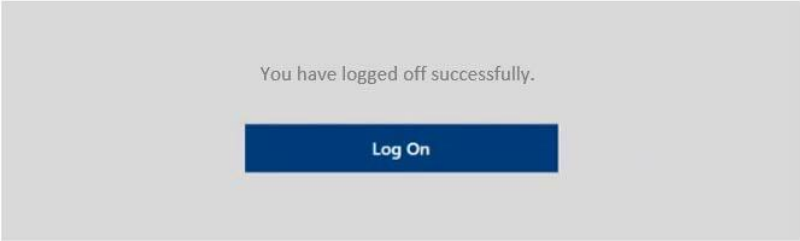
- Repeat steps 4 - 8 to finish setting up the device.

10. When you are finished adding mobile devices, click on your **User name** in the top-right corner.

- Select **Log Off**.

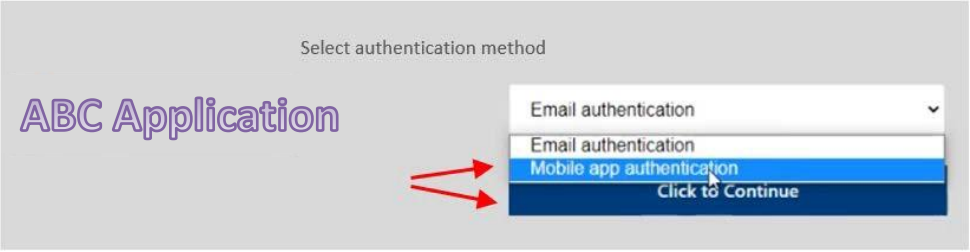


11. On the next screen, click **Log On**.



12. Enter your **User name** and **password**, and click **Submit**.

13. Select **Mobile app authentication** and **Click to Continue**.



14. Open your mobile app and retrieve the new security code.

Note: *If you set up multiple mobile devices, a security code is automatically sent to every device. However, you only need to retrieve a security code from one of your devices to finish logging on.*

15. Enter the security code in the **Passcode** field.

- Do not include spaces.
- Click **Submit**.

Your log on process completes and the ABC Apps screen (or landing page) displays.

Note: *This process does NOT permanently switch your default authentication method from email to mobile. Going forward, you must select* ***Mobile app authentication*** *(per step 13) every time you log on. Otherwise, your security code is sent to email.*
