About this writing sample

This introduction uses an example and diagram to explain two features that control overlapping settings and provide context for the procedure. I worked closely with developers and product managers to identify and address potential areas of user confusion.

Redactions: The application name was changed to VATtax. All links are styled for visibility and disabled.

Access Management and Company-Jurisdictions

Before you start using Access Management and Company-Jurisdictions, it's important to understand what they do. They're separate features that provide different ways to control how users work within VATtax.

- First, you first create users and assign User Roles, and then create companies.
- After that, you use Access Management and Company-Jurisdictions to specify how and where users are can work within VATtax.
- This article provides a brief overview of what each feature does and how they're related. For procedures, refer to Using Access Management.

About Access Management

Access Management has two functions:

- **Create Country/Company/User combinations** - This is required whenever you create a new user or company.
    - Each combination tells VATtax which companies and countries a user is permitted to work with.
    - You cannot import data or configure returns/reports for a company until it's part of at least one Country/Company/User combination.
- **Set User Roles** - This is an optional feature of Access Management that lets you restrict (or limit) some roles that users were assigned in User Management. It provides a way to enforce separation of duties in the return preparation process.
    - This function is disabled in Access Management by default.
    - You must first create a Company-Jurisdiction and enable Limited Roles to configure this feature.

About Company-Jurisdictions

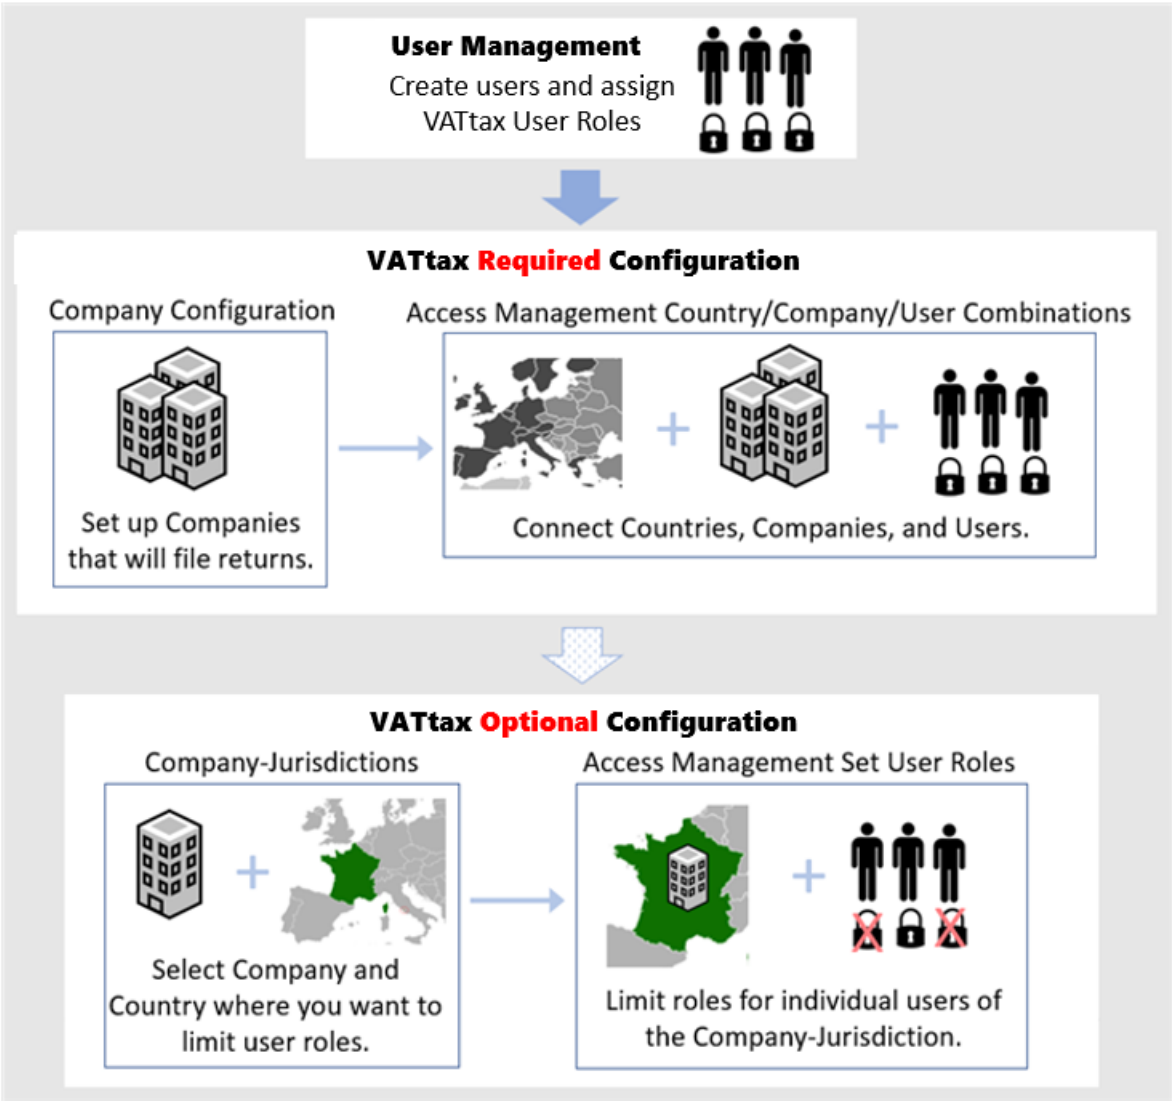
Company-Jurisdictions has one function:

- **Create Company-Jurisdiction combinations** - This is a prerequisite for using the optional Set User Roles feature in Access Management.
  - It unlocks the Set User Roles table in Access Management so you can limit roles.
  - Each Company-Jurisdiction combination tells Access Management the specific companies and jurisdictions where you want to limit user roles.

Example

This example scenario shows the relationship between User Roles, Access Management, and Company-Jurisdictions.

- First, three users were created and given all VATtax permissions.
- Then, three companies were created with various locations in Europe.
- Next, Company/Country/User combinations were created in Access Management, which gave all users access to all companies and jurisdictions.
- In this scenario, only one user is allowed to make changes for Company 1 in France. To enforce this, a Company-Jurisdiction combination (Company 1-France) was created and Limited Roles was enabled.
- Lastly, Set User Roles was used to revoke the Modify Permission for all users who are not allowed make changes to Company 1-France.



User Management
Create users and assign VATtax User Roles
VATtax Required Configuration
Company Configuration
Set up Companies that will file returns.
Access Management Country/Company/User Combinations
Connect Countries, Companies, and Users.
VATtax Optional Configuration
Company-Jurisdictions
Select Company and Country where you want to limit user roles.
Access Management Set User Roles
Limit roles for individual users of the Company-Jurisdiction.
